Yokogawa Teams with Control Dynamics International on Control Systems for LNG Facilities

Houston, TX – 8 Jan 2007 - Control Dynamics International (CDI), a leading supplier of industrial automation systems to the energy industry, announced today a long-term consulting agreement with Yokogawa, manufacturer and supplier of test, measurement, field instrumentation, process control and information products.

The initial project to be done by CDI under the auspices of the consulting agreement will be industrial automation engineering and consulting for the Golden Pass LNG project in Sabine, Texas. Golden Pass is a \$600 million development by ExxonMobil. The project involves cooling natural gas to minus 260 degrees and then loading it on special tankers. Ships would pump the liquid gas into a storage facility, located about two miles from Sabine Pass, where it would be slowly reheated to gas form and distributed through pipelines for commercial use.

Yokogawa maintains a global network of 18 manufacturing facilities, 81 companies, and over 650 sales and engineering offices spans 30 countries. "LNG is a rapidly growing segment of the energy industry and CDI is well prepared to support our customers and partners, like Yokogawa, with advanced automation solutions for LNG," says Van Wilson, President of CDI. "There will be many more projects like Golden Pass as the U.S. develops LNG capacity."

About Control Dynamics International

Founded in 1991 in Houston, Texas, CDI (www.ControlDynamics.com) has grown to be a recognized industry leader in designing and implementing some of the largest, most advanced control solutions for all segments of the hydrocarbon supply chain; upstream, midstream and downstream. CDI has completed over 1,000 process control projects worldwide, including Distributed Control Systems (DCS), Programmable Logic Controllers (PLC) and Hybrid Distributed Control Systems.

CDI employs certified Professional Engineers (PE's) and Project Management Professionals (PMP's), degreed in electrical engineering, computer science and chemical engineering. As an ISO 9001:2000 certified company, the CDI project methodology encompasses all project phases, including design, life-cycle cost analysis, systems and equipment selection, software development,

quality control procedures, and supporting business processes. These rigorous processes and procedures help to assure that projects are on-time, on-budget, and meet the high reliability requirements of the energy industry.
